1. INTRODUCTION

1.1 Purpose and scope

These are the Demand Side Participation Information Guidelines (**Guidelines**) made under clause 3.7D(e) of the National Electricity Rules (**NER**).

These Guidelines have effect only for the purposes set out in the NER. The NER and the *National Electricity Law* (**NEL**) prevail over these Guidelines to the extent of any inconsistency.

These Guidelines specify:

- The information *Registered Participants* are required to provide AEMO.
- When that information must be provided.
- How that information is to be provided.
- AEMO's methodology for assessing the accuracy of that information.
- The manner and form in which AEMO will publish a report on the extent to which that information informed its *load* forecasts.

1.2 Definitions and interpretation

1.2.1 Glossary

The words, phrases and abbreviations set out below have the meanings set out opposite them when used in these Guidelines.

Terms defined in the NER have the same meanings in these Guidelines unless otherwise specified.¹ Those terms are intended to be identified in these Guidelines by italicising them, but failure to italicise such a term does not affect its meaning.

Term	Definition
DNSP	Distribution Network Service Provider
DSPI	demand side participation information
NSP	Network Service Provider
MSGA	Market Small Generator Aggregator
TNSP	Transmission Network Service Provider

1.2.2 Interpretation

The following principles of interpretation apply to these Guidelines unless otherwise expressly indicated:

- (a) These Guidelines are subject to the principles of interpretation set out in Schedule 2 of the NEL.
- (b) References to time are references to Australian Eastern Standard Time.

2. **INFORMATION**

Clause 3.7D(b) of the NER requires *Registered Participants* to provide *demand side participation information* (**DSPI**) to AEMO in accordance with these Guidelines.

¹ Not all of the terms defined in the NER are to be found in Chapter 10; some are defined in clause 3.7D(a) of the NER.

Clause 3.7D(e) provides further information on what this entails. At a high level, this includes:

- contracted demand side participation; and
- the curtailment of *non-scheduled load* or the provision of *unscheduled generation* in respect of the demand for, or price of, electricity.

2.1 Contracted demand side participation information

Contracted demand side participation is defined in clause 3.7D(a)(1) of the NER as information relating to a contractual arrangement between a *Registered Participant* and a person, in which they agree to the curtailment of *non-scheduled load* or the provision of *unscheduled generation* in specified circumstances.

2.2 Non-scheduled load/unscheduled generation information

The reference to the curtailment of *non-scheduled load* or the provision of *unscheduled generation* in respect to the demand for, or price of, electricity in clause 3.7D(e)(1)(ii) excludes information captured by the term *contracted demand side participation*.

AEMO interprets this to include every non-contractual arrangement entered into between a *Registered Participant* and a person, or between two *Registered Participants*.

2.3 Information requirements

Clause 3.7D(e)(1) requires AEMO to specify the information that *Registered Participants* must provide under this rule. The information required by AEMO is specified in **Appendix A**.

The requirements apply to both *contracted demand side participation* and the curtailment of *non-scheduled load* or the provision of *unscheduled generation* in respect of the demand for, or price of, electricity.

3. **RESPONSIBILITIES**

Clause 3.7D(b) of the NER requires all *Registered Participants* to provide DSPI to AEMO in accordance with these Guidelines.

AEMO requires *Registered Participants* to complete a data request in the form detailed in **Appendix A**, and provide all requested data that is available through their current DSPI collection processes, 'current' being as at [insert date]².

Although AEMO does not require *Registered Participants* to enhance their DSPI collection processes for the purpose of complying with these Guidelines, if any *Registered Participant* does so, AEMO expects to receive data obtained by that *Registered Participant* following the introduction of the enhanced DSPI collection process.

3.1 Data submission timing and frequency

Each year, *Registered Participants* must provide data that was current as at 31 March of that year by 5.00 pm 30 April, beginning March 2018.

AEMO will open the web portal for *Registered Participants* to begin their data submissions on 31 March of each year.

3.2 Format of data submission

Each *Registered Participant* must provide the required information through a data portal, available on the AEMO website at [insert link].

² To be completed following the next round of consultation. This is intended to be the date of the publication of the Final Determination and Report.

4. ASSESSING THE ACCURACY OF INFORMATION

4.1 Information to be provided to assist AEMO

The information required to be provided by each *Registered Participant* is at the *NMI* level. This is to enable AEMO to reconcile the DSPI provided in accordance with these Guidelines with other data sources, such as *metering* and pricing databases to assess the accuracy of the data provided.

4.2 AEMO's methodology for assessing accuracy of information

The methodology that AEMO will use to verify the accuracy of the DSPI provided will be to:

- Audit each response and review it for gaps, errors, overlap, duplication, or missing data.
- Review responses against alternative data sets, such as *metering* and pricing data, to determine where incorrect or incomplete information may have been provided.
- Compare responses with those received from the same *Registered Participants* in previous years to highlight new DSPI and to determine where data may have been omitted.
- Compare responses against DSPI-related material published on *Registered Participant* websites.

AEMO anticipates that its ability to verify and assess the accuracy of the DSPI provided in accordance with these Guidelines will evolve over time.

5. **REPORTING**

AEMO publishes a number of reports that address the forecasting of *load*. At least once a year, in one or more of those reports, AEMO will include a discussion on the extent to which DSPI informed AEMO's *load* forecasts.

APPENDIX A. REQUIRED DEMAND SIDE PARTICIPATION INFORMATION

The data model detailed in this appendix specifies the DSPI required by AEMO under these Guidelines. Examples of how a DNSP or a retailer might complete their submissions are shown in Appendix B. For the purposes of the data model, the following terms are defined:

- Connection means the load or generation at the point at which a Customer connects to a distribution network.
- Customer means the owner or operator of the Connection; typically, this will be a retailer's customer.
- DSP means contracted demand side participation or unscheduled generation, or both.
- Program means a scheme operated either by a Registered Participant or a third party, where a group of Customers are incentivised or required to offer DSP in response to criteria defined by the scheme operator.
- Market Participant means a Registered Participant who participates in the wholesale energy market (eg. a retailer).
- Non-market Participant means a Registered Participant who is not a Market Participant (eg. a Network Service Provider).

The data model is split into two sections, as described in the table below.

	Scope	Process
Section 1: DSP Connection types	All demand	• Each Registered Participant to complete this section
Section 2: Larger Connections and Programs	 Applies to Connections and Programs with a potential DSP response greater than 1MW, including: Individual industrial and commercial Connections where demand may vary due to price signals or network loading (eg. an industrial facility partly exposed to the <i>spot price</i>) Aggregated <i>load</i> that may vary due to price signals or <i>network</i> loading, where that <i>load</i> is controlled as a single entity (eg. a group of Connections with battery storage where the operation of the batteries is controlled by a third party, or a set of Connections that are all enrolled in a critical peak pricing Program) 	 Each Registered Participant to complete this section DSP (e.g. once per facility for large Connections)

Data Model Section 1

All Registered Participants are required to complete Section 1 of this data model once per submission. The 'Applies to' column indicates the classes of Registered Participant that are required to complete each category of data.

Category of data	Description / possible values	Field type / validation	Applies to	Other comments
Market-exposed Connections	<i>NMIs</i> of Connections exposed to <i>spot price</i> , either directly or via pass-through contract.	Semicolon separated list, 10 digit NMIs (alternatively 11 digit NMIs including NMI checksum, or 12 digit NMIs including datastream suffix are also acceptable)	Market Participants	
Connections on retail time-of-use tariffs	<i>NMIs</i> of Connections exposed to time-of-use pricing under their retail contract.	Semicolon separated list, 10 digit <i>NMIs</i> (alternatively 11 digit <i>NMIs</i> including NMI checksum, or 12 digit <i>NMIs</i> including datastream suffix are also acceptable)	Market Participants	
Connections on network event tariffs	<i>NMIs</i> of Connections with pricing that depends on <i>network</i> operating conditions (eg. critical peak pricing), separately for each tariff.	Semicolon separated list, 10 digit <i>NMIs</i> (alternatively 11 digit <i>NMIs</i> including NMI checksum, or 12 digit <i>NMIs</i> including datastream suffix are also acceptable) Free text for tariff type	Non-market Participants	This category may be fil (each entry will generate This category covers tar day operating conditions according to a set scheo
Connections with network controlled load	<i>NMIs</i> for all Connections with <i>load</i> that is directly controlled by the NSP (eg. hot water, air conditioning), separately for each <i>load</i> category.	Semicolon separated list, 10 digit <i>NMIs</i> (alternatively 11 digit <i>NMIs</i> including NMI checksum, or 12 digit <i>NMIs</i> including datastream suffix are also acceptable) Select load category {Hot water, Air conditioning, Pool pumps, Other (Specify)}	Non-market Participants	This category may be fil (each entry will generate
Connections with energy storage	NMIs of Connections with on-site energy storage (eg. batteries).	Semicolon separated list, 10 digit <i>NMIs</i> (alternatively 11 digit <i>NMIs</i> including NMI checksum, or 12 digit <i>NMIs</i> including datastream suffix are also acceptable)	Both	
Future Programs	Detail on any upcoming changes to Programs (eg. new tariff classes).	Free text	Both	
Future deployment	List of individual committed contracts or projects where potential DSP response exceeds 1MW.	Free text	Both	This list should include a will fall under the scope
Alerts lists	Detailed information on any electronic distribution lists used by the <i>Registered Participant</i> to disseminate pricing information to assist Customers to determine whether to reduce demand, including how this information is distributed and how AEMO could opt-in to each such list.	Free text	Both	This does not include sa etc.

e any contracts or projects that, when commissioned, e of section 2 of the data model

sales/marketing lists used to promote pricing plans

Data Model Section 2

Section 2 applies to all Registered Participants, however, where a category in Section 1 does not apply (that is, it only applies to Market Participants or Non-market Participants), that Registered Participant does not need to complete Section 2 for that category of DSP. For example, an NSP who did not need to complete the category "Connections on retail TOU tariffs", does not need to complete a Section 2 form for any Connections in that category.

Interpretation of section 2 of the data model:

- Some categories of data have sub-categories that only apply under certain conditions. For example, when filling in data for a residential air conditioner load curtailment Program, it does not make sense to ask for information on embedded generation. Similarly, if no energy storage is associated with the DSP, questions relating to types of storage will not apply.
- Categories that have sub-categories are shown in orange, alongside the options that may be selected for that category. Sub-categories are listed underneath, alongside the categories that they apply to.
- Where a field type of 'Select' is indicated, one of the listed options must be selected. A field type of 'Multi-select' indicates that one or more options must be selected.

Category of data	Sub-category of data	Applies to category	Description / possible values	Field type / validation	Other comm
NMI(s)			Meter number(s) where response will be measured	Semicolon separated list, 10 digit <i>NMIs</i> (alternatively 11 digit <i>NMIs</i> including NMI checksum, or 12 digit <i>NMIs</i> including datastream suffix are also acceptable)	
Meter configuration			Do the supplied <i>NMI(s)</i> directly measure response (eg. on an <i>embedded generating unit</i>), or are they measuring net <i>load</i> (response is behind the <i>meter</i>)	Select {Net load, Direct metering, Other (Specify detailed meter configuration)}

omer is the only party who can control the DSP select True

able for aggregated storage (where the storage re distributed across multiple locations on a network, rate metering points for each device)

able for aggregated storage (where the storage re distributed across multiple locations on a network, rate metering points for each device)

where *load* switching occurs on a daily/regular basis, t water load control, are excluded from this category. y, Programs are excluded where event control is ch that less than 1MW of response occurs in *ation*.

bed event log preferred (ie. log on change), interval ent status also acceptable

uld be provided in Australian Eastern Standard Time

estamps should indicate the **end** of the period in

e expected/requested MW reduction differs from the metered MW reduction (eg. in a distributed *load* control here some devices may fail to activate), both values cluded as separate columns

DSP most critical at times of high *network* stress, which cide with high temperatures

APPENDIX B. EXAMPLE SUBMISSIONS

Example: Distribution Network Service Provider

The following example shows how a DNSP might complete the data request. In this example, the DNSP has a large number of residential customers with hot water load activated by ripple control, and also engages a third party aggregator to manage a group of distributed battery storage systems to shift load from the evening peak back toward the afternoon.

Items are shown crossed out when they do not apply – in the example below, the hot water load control Program does not include any *embedded generation*, so the question on fuel source is excluded.

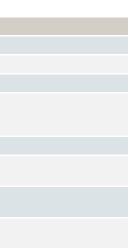

Section 1

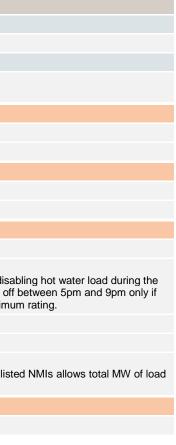

Market exposed Connections	N/A
Connections on retail TOU tariffs	N/A
Connections on network event tariffs	Nil
Connections with network controlled load	Hot water load control
	1234567890;2345678901;3456789012; etc.
Connections with energy storage	4567890123;5678901234 etc.
Future Programs	We plan to expand our ripple control Program to cover air conditioning units by November 2017. We estimate 2000 Connections will participate in the new Program over the 2017/18 summer.
Future deployment	We will be installing a 2MW, 5MWh battery at XYZ terminal station to provide backup for feeder ABC and to allow us to defer augmentation of the number 1 transformer by reducing peak demand.
Alerts lists	Email list used to alert customers on critical peak pricing tariffs about upcoming peak days. AEMO can opt-in by contacting alerts@examplednsp.com.au

Example: Retailer

The following example shows how a *retailer* might complete the data request. In this example, the *retailer* has a contract with a large industrial Customer that partially exposes the Customer to the *spot price*. The *retailer* also has a number of commercial Customers on time-of-use tariffs, and is running a pilot program where 500 residential Customers with battery storage systems agree to let the *retailer* control their batteries to limit its exposure to high summer *spot prices*.

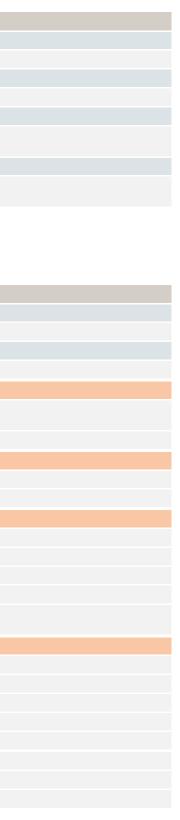

Section 1

Market exposed Connections	6789012345;7890123456	
Connections on retail TOU tariffs	8901234567;9012345678 etc.	
Connections on network event tariffs	N/A	
Connections with network controlled load	N/A	
Connections with energy storage	1234567890;2345678901 etc.	
Future Programs	We will begin a Program in 2017 to incentivise agricultural customers to curtail their pumping load at times of high wholesale prices. Initial rollout will begin in central and northern Victoria.	
Future deployment	None	
Alerts lists	We alert our customers on time-of-use tariffs when summer pricing comes into effect. AEMO can sign up on our website at http://exampleretailer.com.au/signup

Response control		Customer Direct
	Controller	Example Facility Ltd.
	Trigger condition / algorithm	Spot Price
	BAU control algorithm	Ad-hoc activity
	Opt-out ability	
	Audit ability	True Interval meters installed
Storage		None
	Storage capacity	
	Purpose	
	Installation date	
	Export permitted	
	Inverter	
Historical timing and magnitude of response		N/A
Monitoring and activation		Market interval meter
Seasonality		None

Temperature restrictions	None
Expiry date	N/A

Section 2: Battery storage pilot

NMI(s)		1234567890;2345678901 etc.
Meter configuration		Net load
Name / Address / Program name		Inner West battery storage trial
Available load reduction / generation increase / storage output		1.7 MW
DSP type		Energy Storage
	Load Type	
	Fuel Source	
Price exposure		None
	Trigger price	
	Tariff type	
Response control		Retailer
	Controller	Example Retailer
	Trigger condition / algorithm	Spot price Used to limit hedging expense by reducing demand at times of h
	BAU control algorithm	Minimise customer energy expense
	Opt-out ability	False
	Audit ability	True Two-way communications to battery available
Storage		Battery
	Storage capacity	3.2 MWh
	Purpose	Customers with existing battery systems incentivised to join pilot
	Installation date	N/A
	Export permitted	True
	Inverter	N/A
Historical timing and magnitude of response		Timestamp,Event Status,MW requested,MW observed 2015-01-22 17:30:00,Active,1.7,1.5 2015-01-22 17:05:00,Inactive,0,0 etc.
Monitoring and activation		Other Proprietary 3G communications devices installed
		Other Proprietary 3G communications devices installed None
Monitoring and activation Seasonality Temperature restrictions		Proprietary 3G communications devices installed
